

# SCANDRIA Workshop

## February 28 2012

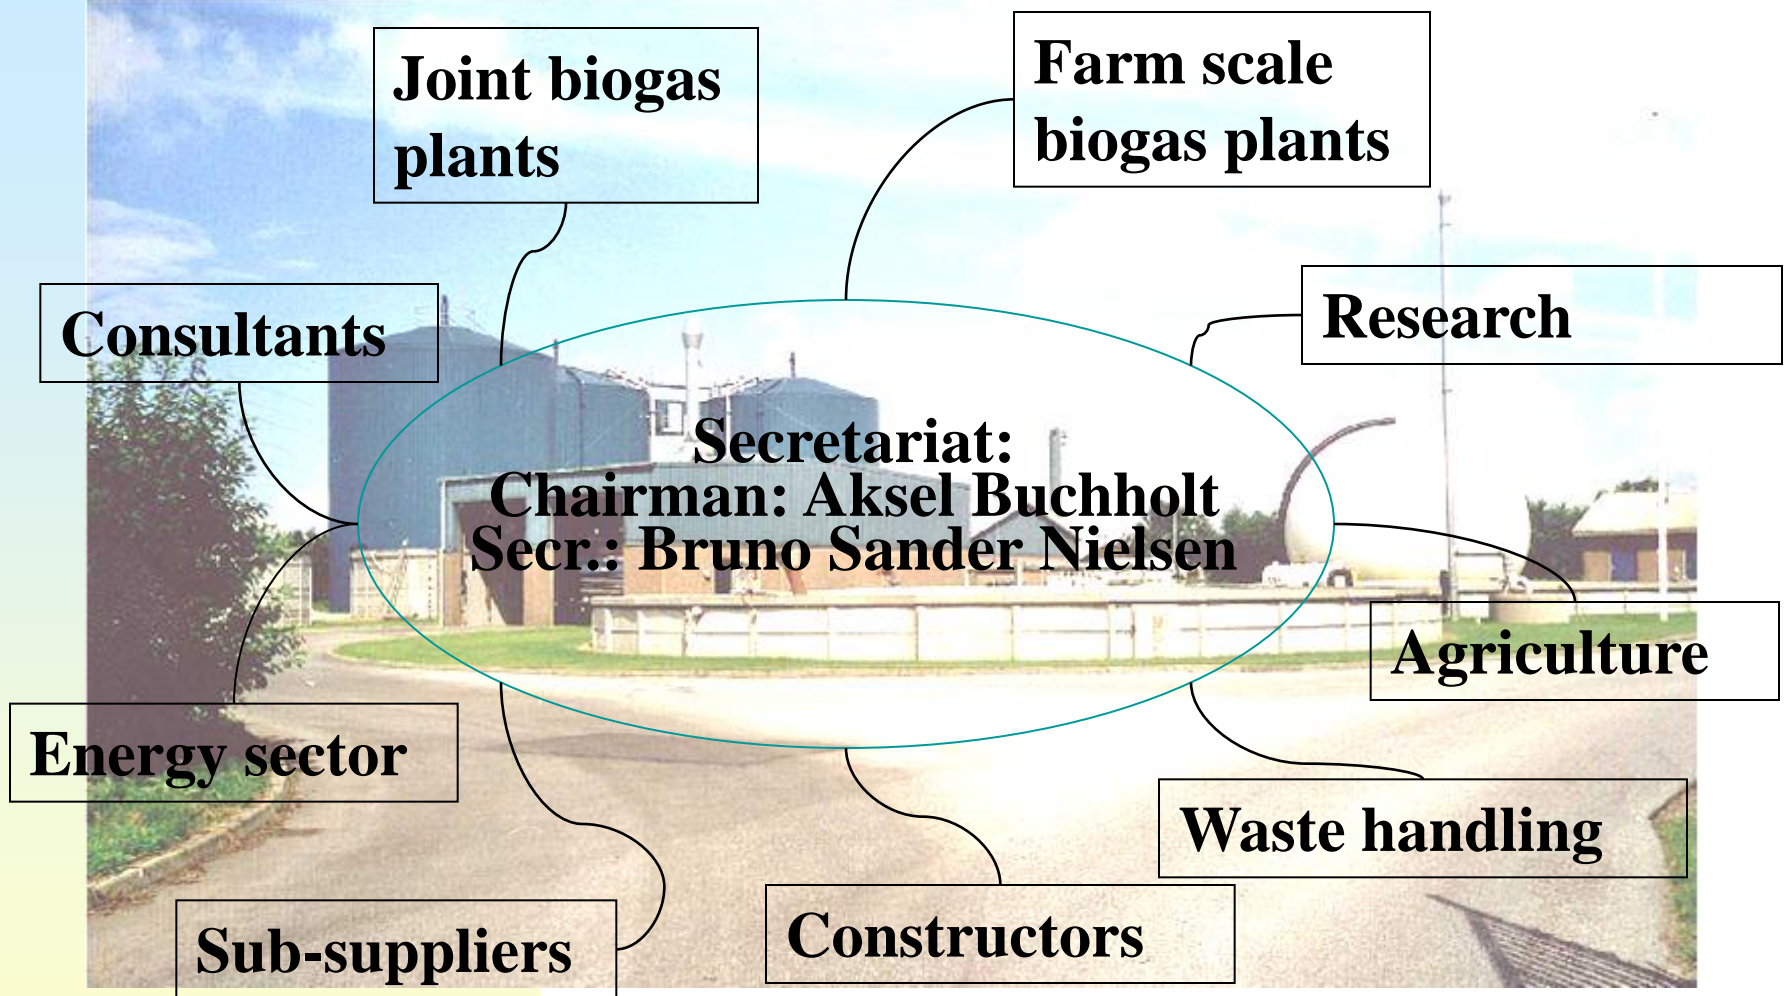

---

### **The current political obstacles towards the introduction of biogas for the road transport**

By Bruno Sander Nielsen  
Danish Biogas Association

# Danish Biogas Association

# Diversification of Energy Supply

# Danish energy sector

## From centralized power plants to decentralized production

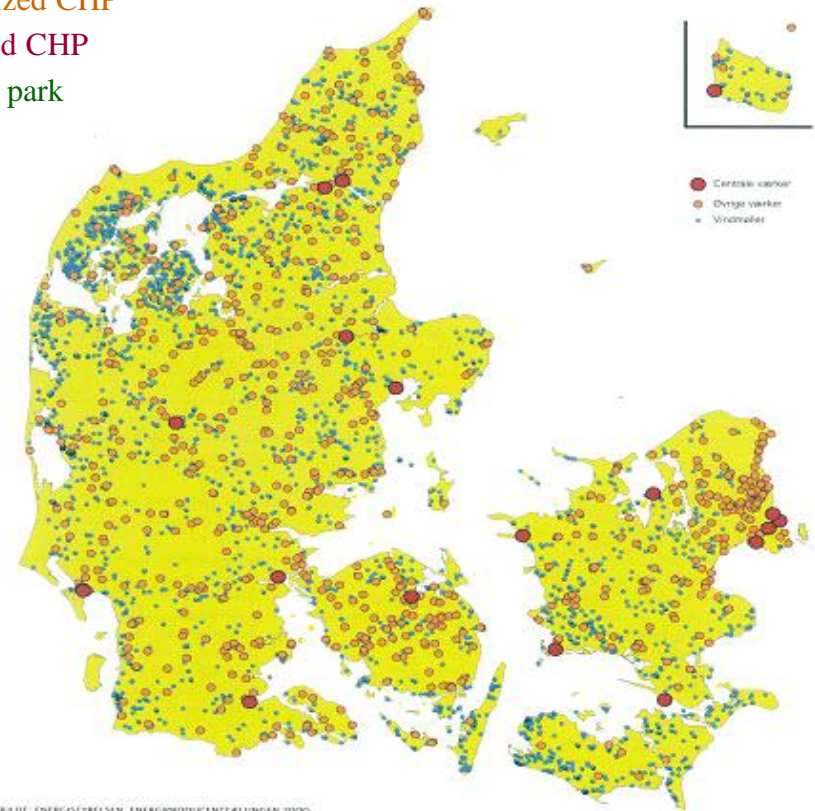

Centralized production in the mid 80's

*Legend:*

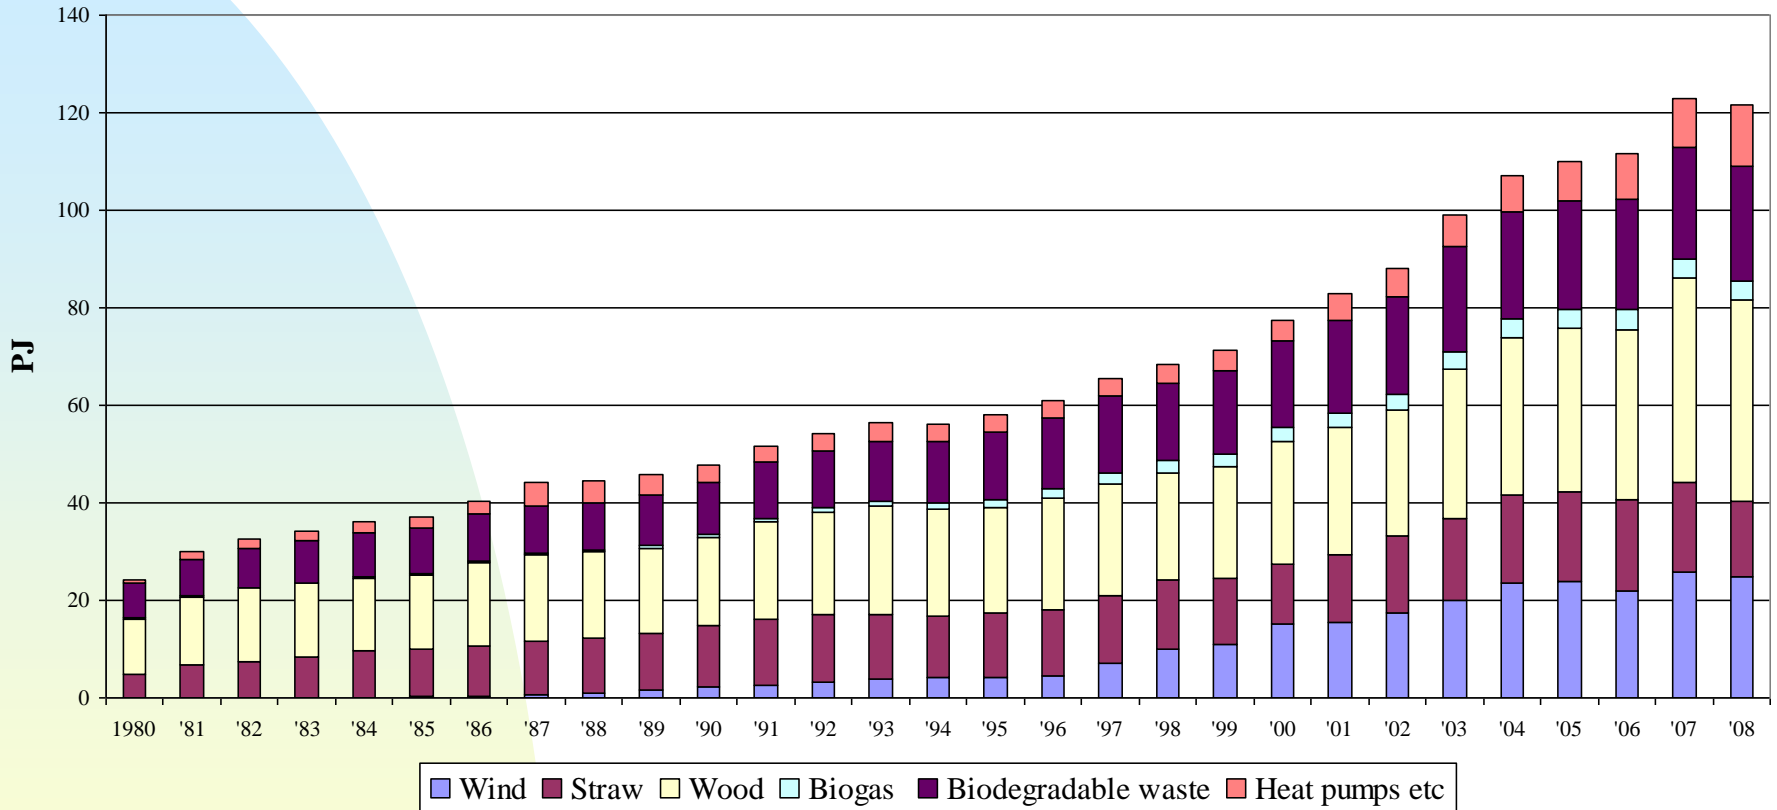

- Decentralized CHP
- Centralized CHP
- Wind mill park

Decentralized production of today

KILDE: ENERGISTYRELSEN, ENERGIPRODUKTION I ÅLLINGEN 2000, VINDMØLLEKOORDINATER, KØBT A. MÅTRESTYRELSEN 2001

# Renewable energy in Denmark

# Danish energy policy

- From oil to coal, natural gas and renewables
- Widespread natural gas grid
- From centralised power plants to decentralised co-generation of power and district heating
- Transportation is fossil
  - ◆ No tax reductions on biofuels
  - ◆ Market financing 5,75 and 10 per cent renewables
- High share of windpower in power system
  - ◆ Renewable but unpredictable and unreliable
  - ◆ Backup systems needed

# Biogas -stable and flexible

## Biogas production

- ◆ Continuous, stable and predictable
- ◆ Up/down regulation through seasons

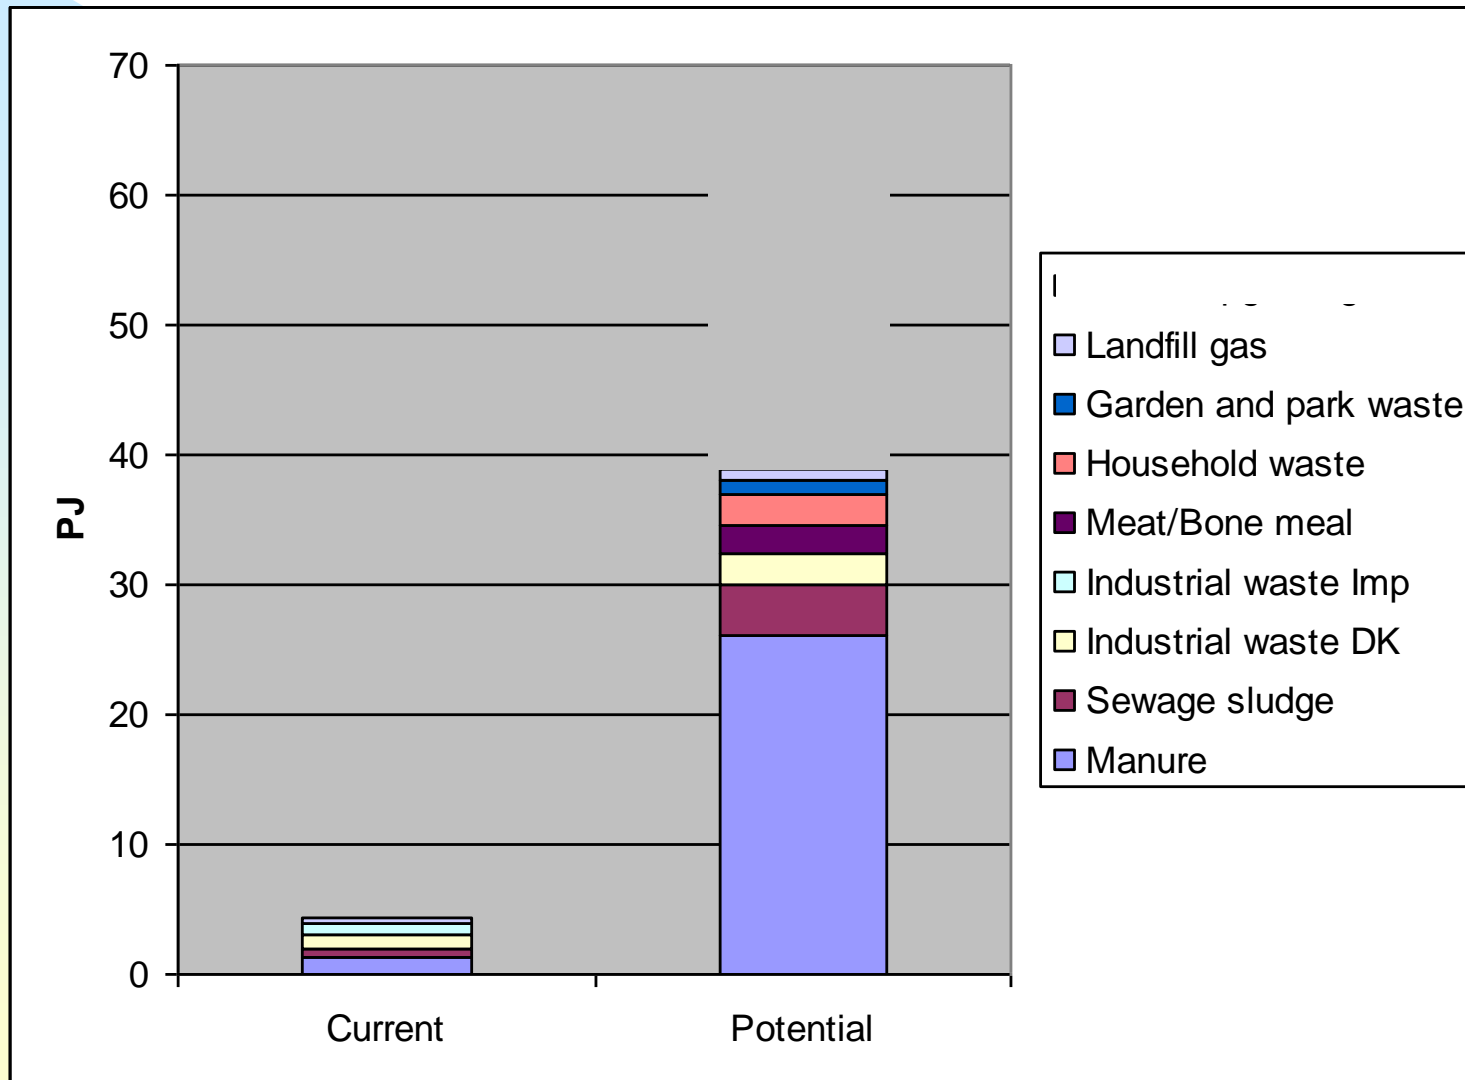

## Biogas utilisation

- ◆ Adaptation to demand
- ◆ Storage on biogas plant
- ◆ Back-up for windpower
- ◆ Injection into gas grid
- ◆ Transportation
- ◆ Engines and fuel cells

Danish Biogas Association

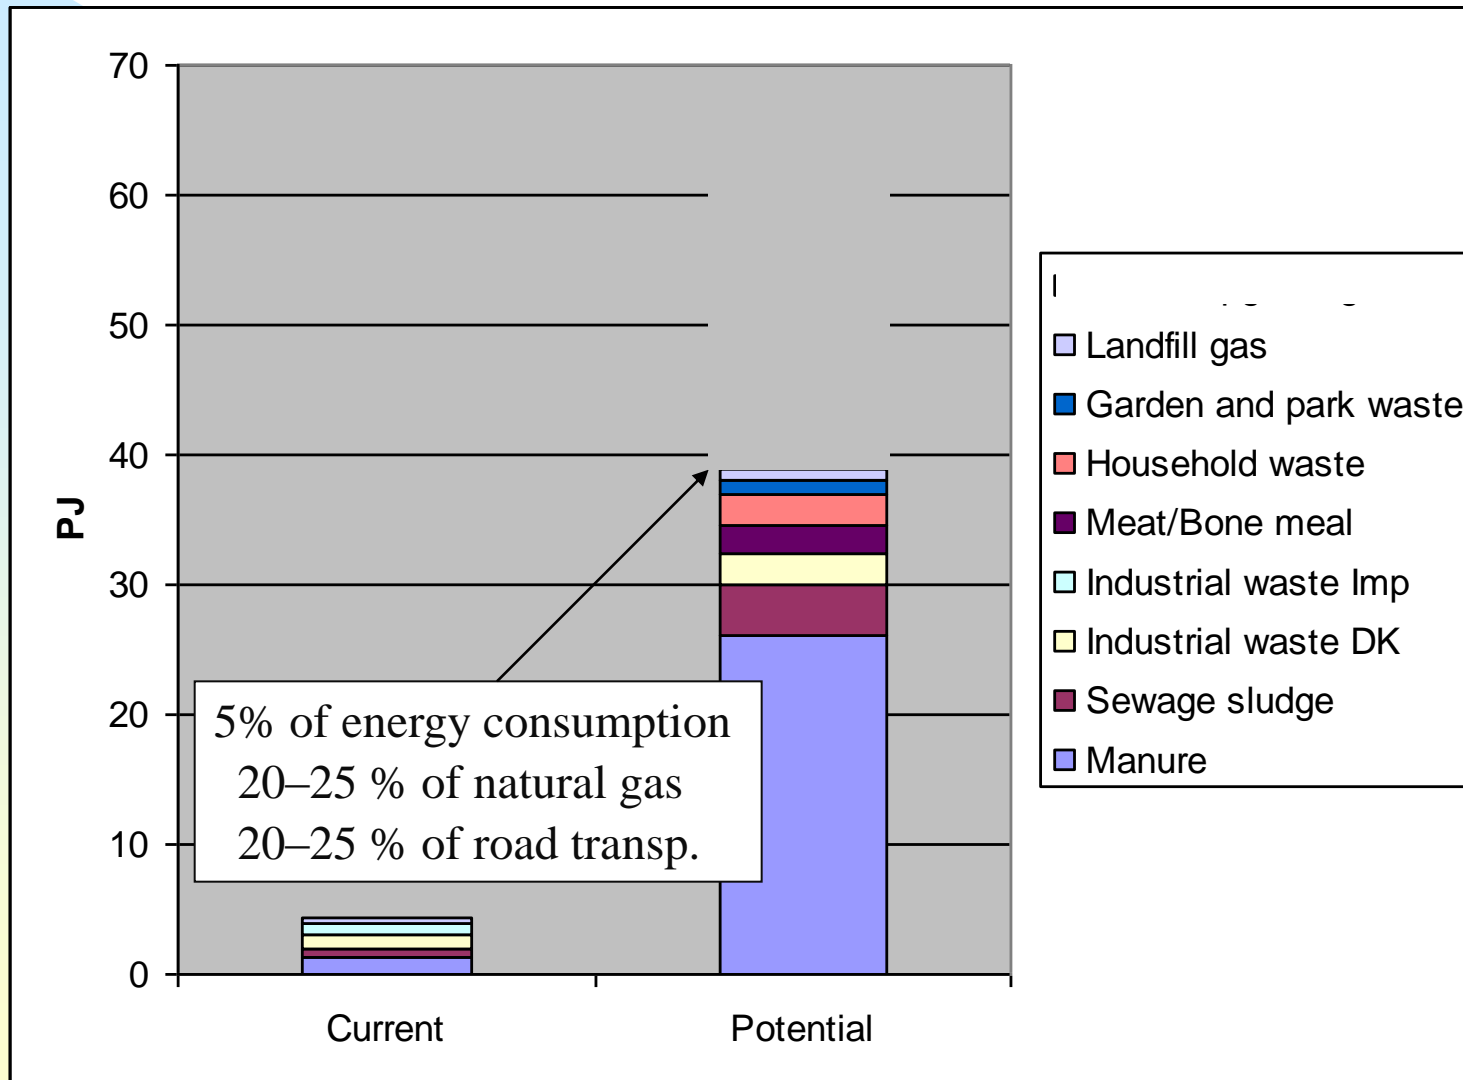

# Biogas – currently and potential

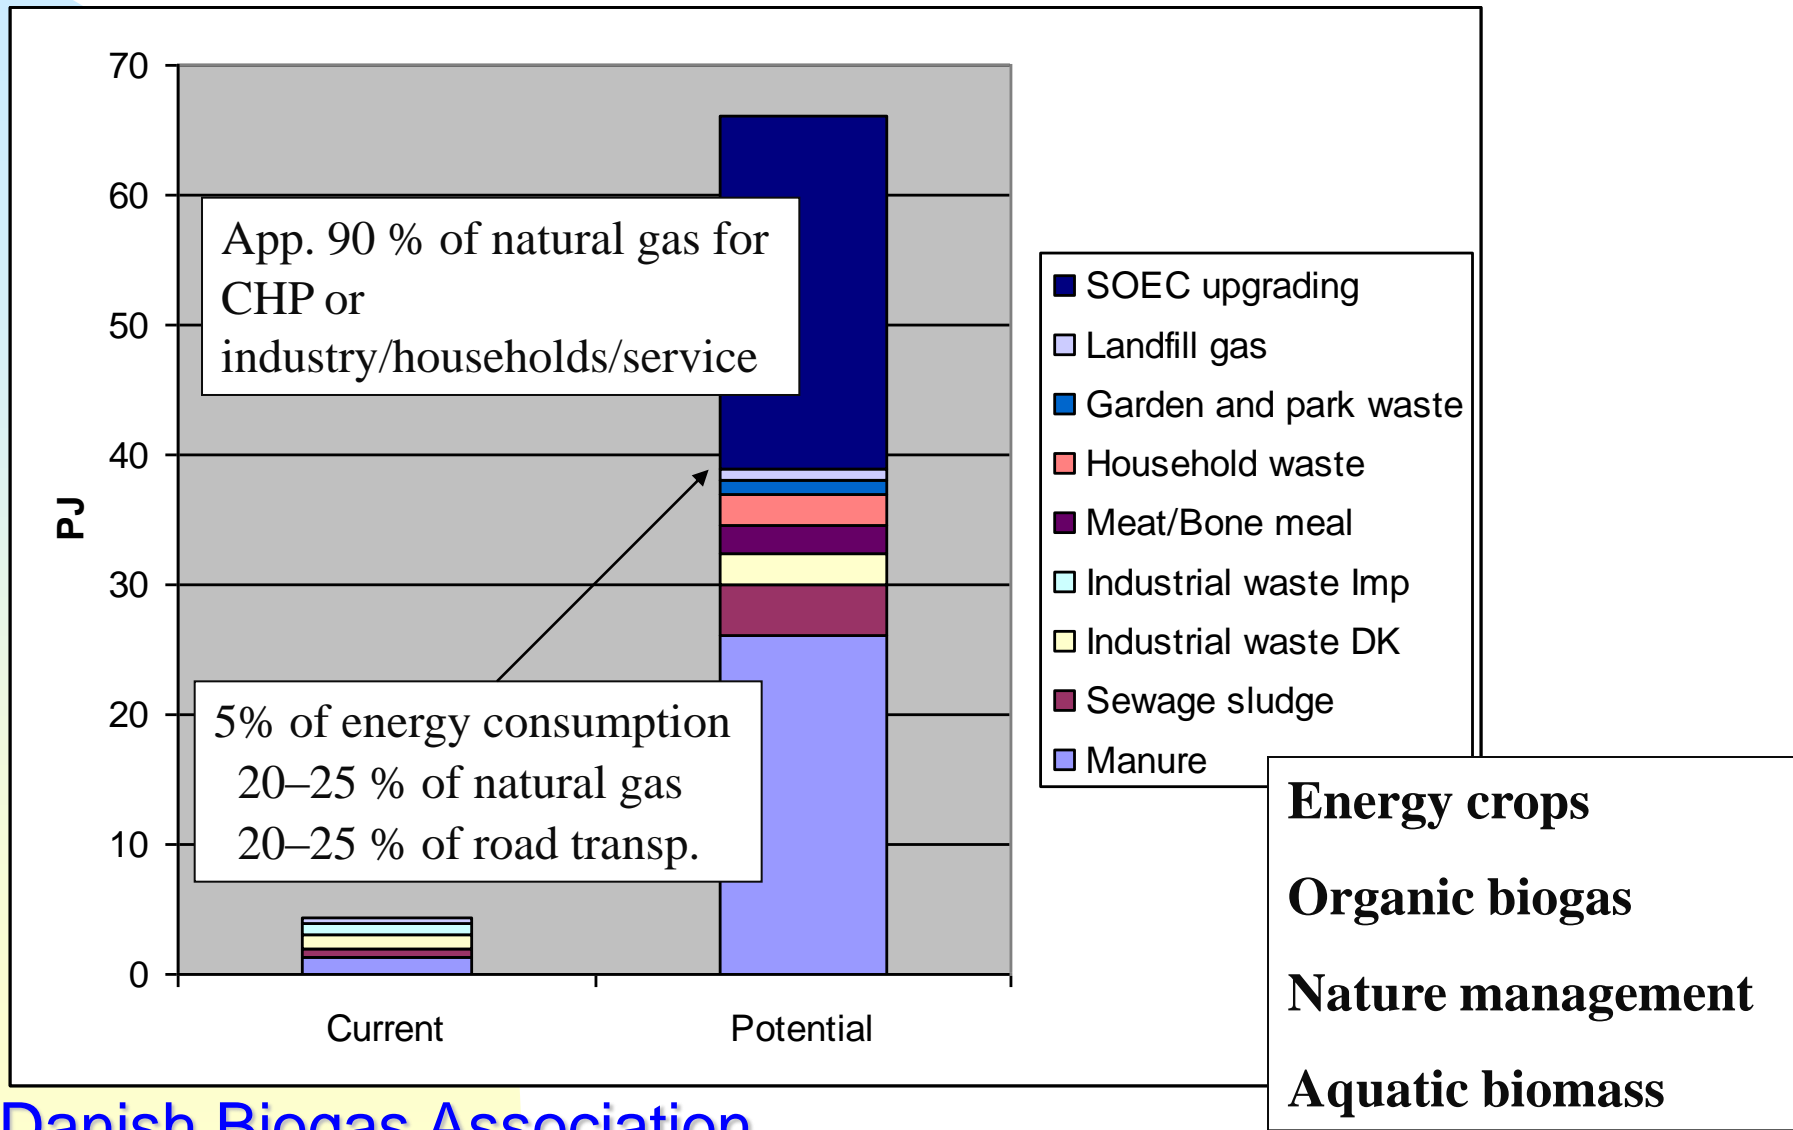

# Biogas – currently and potential

# Biogas – currently and potential

# Biogas – currently and potential

# 25 years of Danish biogas experience

Manure - from a farmers  
problems to an opportunity for  
the whole society

# Biogas plants

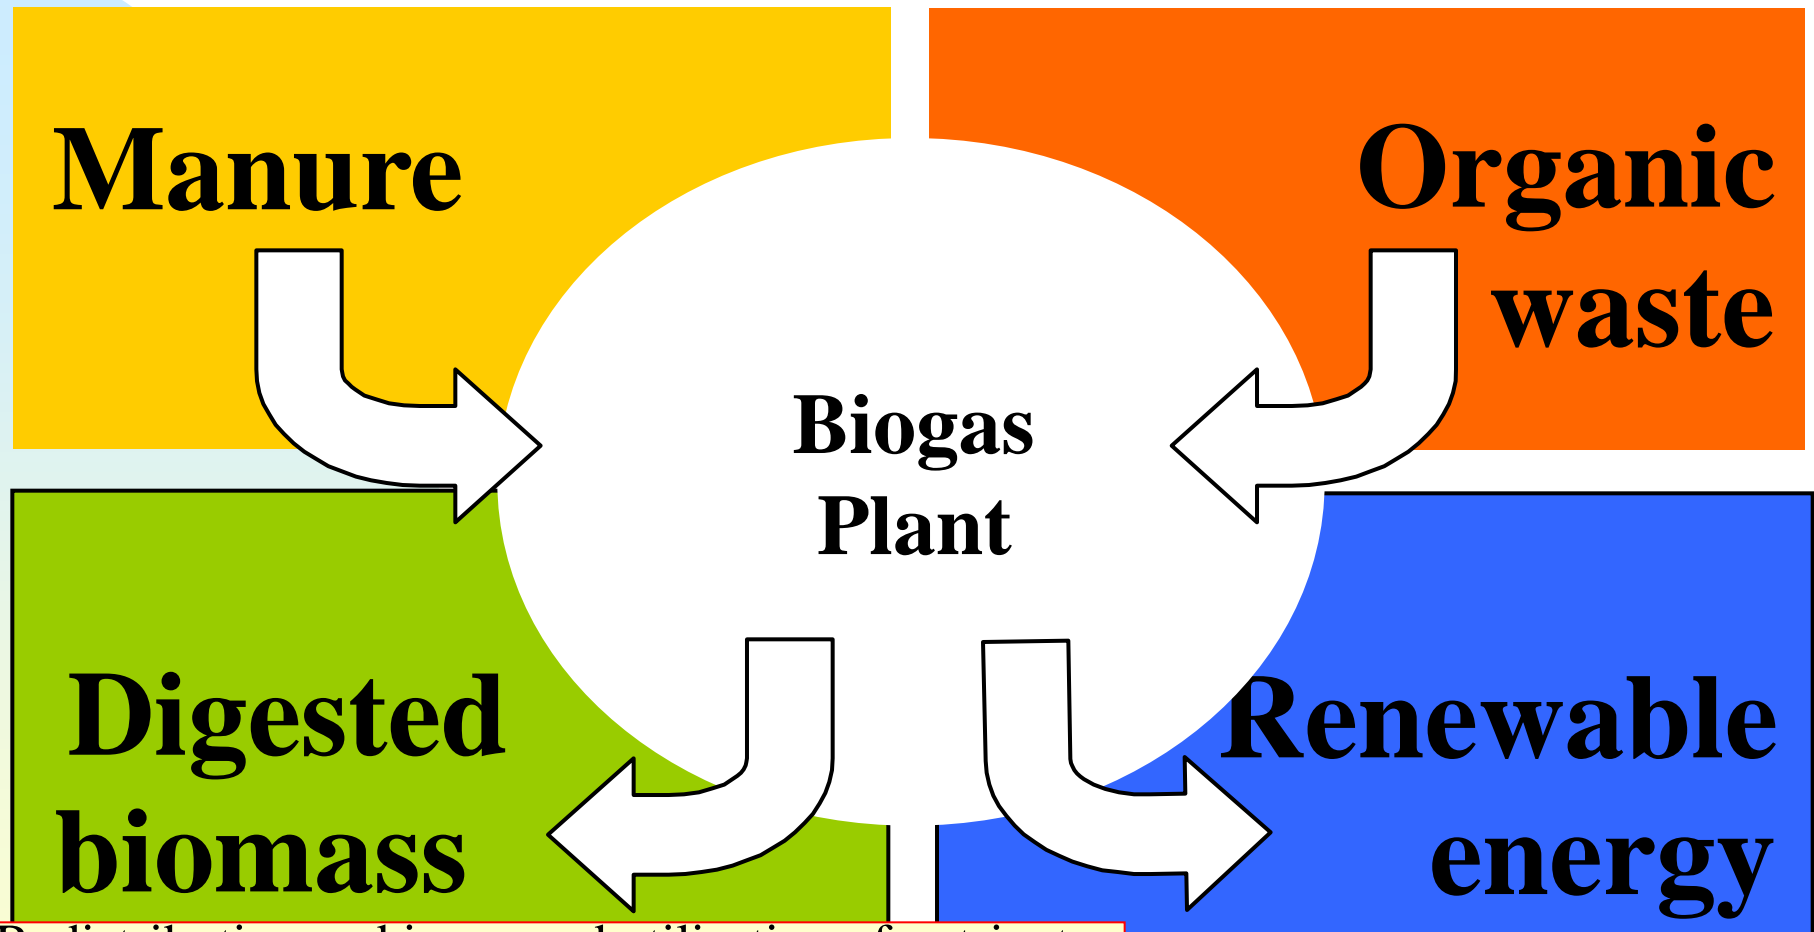

- Not only for production of renewable energy
- But a multifunctional technology for
  - ◆ Renewable energy and energy supply security
  - ◆ Sustainable agricultural development
  - ◆ Environmental protection
  - ◆ Rural development

# Biogas - in principle

# Biogas - in principle

Redistribution and improved utilisation of nutrients  
Protection of aquatic environment, less smell

# Biogas - in principle

Sustainable agricultural production,  
food supply and export

Protection of aquatic environment, less smell

Energy supply security  
Combined power and heat  
Transportation?

# Danish biogas plants

## Number of plants

- 22 centralised biogas plants
- 60 farm scale biogas plants

## Biomass in biogas plants

Manure	2 mill. t
Organic residues	0.5 mill. ton
Total	2.5 mill. ton

# Manurebased biogas

# Payment for electricity from biogas

# Advantages of biogas plants

- Greenhouse gas reduction
  - ◆ Efficient
    - ☞ heat and power: 220 %
    - ☞ transportation: 167 %
  - ◆ Cheap
    - ☞ 0 to 6 \$

# Why promote biogas?

- Renewable energy supply
- Stabilisation of wind dominated power system
- Efficient and cheap reduction of greenhouse gases
- Ready to go fuel for transportation
- Environmental protection (aquatic, smell etcetera)
- Recirculation of nutrients (phosphorous etcetera)
- Synergies to organic and conventional agriculture
- Growth and employment
- Export of food and biogas technology

Danish Biogas Association

# Utilisation of biogas

## Current situation

### Substitution of natural gas in CHP

- Fits into decentralised structure
- Directly in local CHP plant
  - ◆ Cheapest and most simple
  - ◆ - if the heat can be utilised
  - ◆ Feed-in tariff :10 cent/kWh 2008 + annually regulation (60 pct. inflation)

## Future development

### Upgrading and distributed in gas grid

- ◆ Storage capacity
- ◆ Improved utilisation of heat?
- ◆ Upgrading very expensive
- ◆ Downgrading of natural gas ?

## Transportation fuel

- ◆ Most efficient biofuel
- ◆ New infrastructure necessary

Danish Biogas Association

# Government Green Growth Plan 2009

## Promotion in biogas through

- From currently 5 % to 50 % of manure into biogas in 2020
- Co-ordination plan for construction of biogas plants
- Plan for integration of biogas into the energy sector
- Obligation for municipalities to point out where to build plants
- Distribution in natural gas grid on equal terms as direct co-generation
- Equal opportunities for biogas to earn money as natural gas suppliers
- Financing
  - ◆ 20 % construction subsidy (in total 300 mill. DKK from 2010 to 2012)
  - ◆ loans guaranteed by municipalities
  - ◆ Capital from investors

Danish Biogas Association

# Energy policy negotiations

- Government proposal from Nov. 25 2011:
  - ◆ Keep up with current system for CHP
  - ◆ Improved economy for manure based biogas
  - ◆ Feed in tariff for upgraded biogas injected to the grid as for CHP
  - ◆ New subsidies for biogas for transportation
- Waiting for a political agreement
  - ◆ Moves into right direction – though still not enough
  - ◆ Opening up for biogas for transportation

# Promotors for biogas in transportation

- Denmark has a widespread (natural) gas infrastructure
- Biogas is the most efficient and cheapest tool to reduce GHG emissions (double counting and double function)
- Natural gas is a corporate and socio-economic preferable alternative to gasoline and diesel – biogas will be too
- Biogas much more energy efficient than bioethanol and biodiesel
- Electricity is not an option for heavy duty vehicles
- Reduction in health hazardous emissions
- Less noise from transportation
- Biogas production potential higher than local demand for CHP

# Obstacles for biogas in transportation

- Denmark has a widespread (natural)gas infrastructure for CHP
- It is cheaper and more efficient to reduce emissions in CHP sector
- Subsidies for renewable energy is directed to power and heat sectors
- We do not have a gas infrastructure for transportation
  - ◆ Filling stations
  - ◆ Vehicles
- Bioethanol and biodiesel fits into existing infrastructure
- Public focus on electricity for transportation
- Biogas loose subsidies and becomes taxed when injected into gas grid
- Higher tax on gas vehicles due to higher price
- Public transportation is driven by reduced cost on short term

# 30 years of incentives in Denmark

## Society

- Decrease dependency on imported fossil fuel
- Protection of drinking and surface waters
- Decrease emission of greenhouse gases

## Agriculture

- Improved utilisation and storage capacity
- Relations to neighbours
- Redistribution of manure
- Extraction of surplus of nutrients

## Development promoted by

- Legislation regarding handling of manure and energy
- Subsidies for research, demonstration, documentation, etc.
- Framework conditions:
  - construction subsidy and premium price for electricity

# Conclusion

- Biogas is on the political agenda in Denmark
  - ◆ Primarily for use in CHP sectors and to stabilize power system
  - ◆ Increased focus on biogas for transportation – the first renewable fuel to be directly subsidised
- Biogas fits into both decentralised structure and whole grids
  - ◆ Gas grid and CHP infrastructure preferred utilisation of biogas
  - ◆ Gas grid can promote use of biogas in transportation
  - ◆ Green gas certificates - a new driver
- Need a targeted development of infrastructure and market
  - ◆ Demonstration/infrastructure programme
    - ☞ filling stations
    - ☞ pioneers in biogas fleets (public transport)
  - ◆ Next energy act may promote (feed in)

**Thank you for  
your attention**
